

Adding Issues to Structure

You can add an issue to a structure both from the [Structure Board](#) and from the [Issue Page](#).

On the Structure Board, use [Search](#) to find the desired issues and add them to a structure using [drag-and-drop](#), [copy/paste](#), or the **Add** button on the search panel.

When searching, make sure the [JIRA Search Results](#) secondary panel is switched on. Use **More Issues** button on the search panel.

The screenshot shows the JIRA Structure Board interface. The search results panel on the right lists the following issues:

Key	Summary
DRIVE-33	Fuel Efficiency
DRIVE-37	Utilize bubble effect -
EMPR-24	Strange effects when hyper-jumping near a black hole

Red annotations indicate the process: "Select issues" points to the search results panel, and "Drag and drop to a desired position" points from the search results panel to the main structure board.

On an Issue Page, if the issue you are viewing is not in the current structure, the Structure section contains [Current Issue secondary panel](#) and you can drag the issue to the current structure from there. You can also [select a different structure using Structure Selector](#). Besides, you can use Search on the issue page as well and add other issues to the structure.

Adding issues to a structure can be [undone](#).
