## **Extending Structure Functionality**

You can add functionality to the Structure Plugin itself by creating a plugin that uses one of the available Structure extension points.

- Creating a New Synchronizer Structure comes with a number of bundled synchronizers, but you can add another synchronizer to the system, allowing Structure users to install it on structures and run export / import.
- Loading Additional Web Resources For Structure Widget To include a web resource (such as custom CSS or JavaScript file) on the page every time Structure Widget is displayed, use structure widget web resource context.
