

Tag

Tag is a special mark that you can assign to particular issues for quick access in the [Navigation Area](#). Tags work like folders allowing you to gather a set of issues from different queries for later access and processing.

The **Tags** folder in the **Navigation Area** contains a default **Favorites** tag  .

Showing: None (in ALM Works - Sample Queries - Projects - JIRA Client 1.x - Fix Versions)

No hierarchy ▾

Flags	Key	Summary
	JCO-154	Trying to change "Affect versions in" in existing queries cause crash
	JCO-160	"Original Estimate" value cleared when changing JIRA ticket status
 <input checked="" type="checkbox"/>	JCO-191	Connection tree node does not have implicit project-based filter even if connecti.
 	JCO-228	Nested "Create Distribution" created duplicate nodes
 	JCO-122	"Open selected issue in browser" keystroke not working on Mac OSX
<input checked="" type="checkbox"/>	JCO-290	DST incorrectly applied in Arizona (detect server time zone through comparing T..

You can also create and apply your own tags to one or several issues. To do so:

- Drag issues from the **Issues table** and drop them to a desired tag if it already exists in the **Tags** folder.

If the tag does not exist, you can create it:

1. Select a desired issue, right-click and select **Tags** or press **Ctrl + T** (+ T).
The **Tag Issue** dialog opens.
2. Click **New Tag** button, type the tag name, select an icon and click **OK** in the **New Tag** dialog.
The tag is created and applied. The issue has a new tag in the **Flags** column of the [Issues Table](#) and appears in the newly created Tag folder in the **Navigation Area**.
