# Using Issue Navigator Columns

Structure can display the same columns as the Issue Navigator when showing search results.

You can toggle Issue Navigator columns by clicking **Columns** button in the Search toolbar.

When Issue Navigator columns are turned on, Structure temporarily switches to a system view that displays the same columns as Issue Navigator would display for that query. To switch back to your usual view, switch off the **Columns** button or switch off **Search** panel.

> ✅ A separate columns configuration may be defined for a Saved Filter. When you use a saved filter in your JQL query (`filter = "filter-name"`), Structure detects that and will display columns defined for that filter. (If **Columns** button is turned on, of course.)

> ⚠️ If you have a **Progress** column in the Issue Navigator, then the Structure's **Progress** column will be shown instead. The same applies to aggregate columns like **Original Estimate**. Please keep in mind that these Structure columns and their JIRA counterparts work by different rules, and may display different values.
