API Changes in Structure 2.10

1. Minor Java API Release

This release just adds a new event type to the Java API. The changes are backwards-compatible.

JIRA Version	New API Version
6.x	8.7.0

See Structure API Versions for full version information and downloads.

2. Compatible Changes in the Java API

2.1. New Event Type in `JiraChangeType`

Structure now has a separate component which monitors *Sprint* custom field update for all issues, and fires additional event of type `JiraChangeType.GH_SPRINT_UPDATED` for JIRA sub-tasks of the changed item. This is useful because sub-task inherit Sprint value from their parent issue.

See `IssueEventBridge` in the Structure API docs.
