

API Changes in Structure 2.11

1. Minor Java API Release

This release just adds a new event type to the Java API. The changes are backwards-compatible.

JIRA Version	New API Version	Structure Plugin Version
6.3 – 6.4.x	8.8.0	2.11.0.jira6
7.0	8.8.0	2.11.0.jira7

See [Structure API Versions](#) for full version information and downloads.

2. Compatible Changes in the Java API

2.1. Added `UserCompat` class

In order to have a single source code for JIRA 6 and JIRA 7 we had to add `UserCompat` class that implements both `User` and `ApplicationUser`.

API clients do not have to do anything about this, however, you may find it useful if you also need to compile your plugin against otherwise incompatible JIRA 7 and JIRA 6 API.

Note, however, that while it allows to have a single version of source code for conflicting API versions, it requires separate compilation with JIRA 7 and JIRA 6 API, resulting in two versions of a plugin.

2.2. Removed `com.atlassian.usercompatibility` dependency

The implicit dependency on `com.atlassian.usercompatibility:usercompatibility-jira` has been removed. This should not affect other plugins.

2.3. Additional utilities

More functions have been added to `JiraFunc` and `StructureUtil` classes.
