[Quick Start Guide](#)

1. Incremental Update

This is an incremental update for the Structure.Pages. It contains new features, important improvements and some fixes.

1.1. Confluence 6.0 and Data Center compatibility

Structure.Pages plugin is now compatible with Confluence 6.0 and Confluence Data Center. The minimum supported version is Confluence 5.9.

1.2. Inline Page Title Editing

It is now possible to change the title of a confluence page using an inline editor on the Structure panel. If a corresponding details panel was open during the change it will be reloaded.

1.3. Page Properties Export

Columns with Confluence page properties, such as Last Edited, Space, Last Editor and Location can now be exported to Excel or to the Printable page by using export feature on the Structure Board.

2. Installation and Configuration

A system with Structure and Structure.Pages contains a number of moving parts, some of them from ALM Works, some of them from Atlassian. Therefore, it is very important to correctly install and configure all these parts before trying to build structures with pages.

In brief, the procedure is:

1. Make sure you have compatible versions of JIRA and Confluence.
2. Install Structure and Structure.Pages on JIRA.
3. Install Structure.Pages Helper on Confluence.
4. Configure Confluence to accept Remote API calls.
5. Configure Application Link between JIRA and Confluence, or make sure it is configured correctly.
6. Enable Confluence integration in Structure system settings.
7. Monitor JIRA and Confluence logs for messages from Structure.

For a detailed description of the procedure, please see the [User's Guide](#).

2.1. Upgrade

- If you have installed Structure.Pages beta or release candidate, please read [Structure.Pages 1.0.0 Release Notes](#)

If you have Structure.Pages installed and working, then you have already figured out the correct configuration. The upgrade should be straightforward:

1. Upgrade Structure add-on to at least version 3.4.0.
2. Install Structure.Pages 1.2.0, either from the Marketplace or from [Download](#) page.
3. On Confluence side, install Structure.Pages Helper 1.2.0.
4. Verify that all plugins are enabled and that on **Administration | Structure | Confluence Integration** you have the link to your Confluence enabled.
5. Monitor JIRA and Confluence logs for messages from Structure.
