

Removing Synchronizer

Dark Feature - Synchronizers are hidden by default

We recommend using [Automation](#) instead of Synchronizers. Automation is safer, provides additional functionality and flexibility, and uses fewer system resources.

To enable synchronizers, see [Advanced Configuration and Dark Features](#).

You can remove an installed synchronizer at any time if you have **Control** permissions for the structure.

1. Open the **Manage Structure** page using the top navigation Structure menu.
2. Find the structure you need to remove a synchronizer from. You can look at the *Sync With* column to see which synchronizers are installed in a structure.
3. Click **Settings** link for the selected structure.
4. Find the synchronizer in the list and use the **Delete** link to remove it.

If the synchronizer is currently performing an incremental sync or resync, it will be allowed to finish.
