

Bundled Synchronizers

Dark Feature - Synchronizers are hidden by default

We recommend using [Automation](#) instead of Synchronizers. Automation is safer, provides additional functionality and flexibility, and uses fewer system resources.

To enable synchronizers, see [Advanced Configuration and Dark Features](#).

There are several bundled synchronizers included with Structure. Other synchronizers can be provided by other Jira add-ons.

- [Sub-Tasks Synchronizer](#) — The Sub-Tasks Synchronizer automatically places sub-tasks under their respective parent issues in the structure.
- [Filter Synchronizer](#) — The Filter Synchronizer automatically adds issues to a structure or removes issues from a structure based on a Saved Filter or a JQL query.
- [Links Synchronizer](#) — The Links Synchronizer maintains issue links between parent issues and child issues.
- [Agile Synchronizer](#) — The Agile Synchronizer lets you synchronize the position of issues in the structure and on an Agile board (such as a Scrum or Kanban board) using Rank synchronization, and synchronize Epic fields with the position of stories under epics in the structure.
- [Status Rollup Synchronizer](#) — The Status Rollup synchronizer automatically aggregates statuses of the sub-issues and updates the status of the parent issue. For example, if all sub-issues are Resolved, it can update the parent issue's status to Resolved.

Synchronizers are now a dark feature, meaning they are hidden from users by default. To enable synchronizers, use the [Structure Dark Features and Fine Tuning Interface](#).
