

Creating and Adding Folders

You may need to create a new folder and add it to a structure.

Folders and generators are items that are managed entirely by Structure add-on, so you'll need to use Structure's services to create the item first, giving you the item identify, and then insert a row into a forest.

Read more about [Changing Structure Content](#) for general ideas about updating a structure.

1. Create the Folder entity

```
long folderId = myStructureComponents.getFolderManager().createFolder(Folder.named("My Stuff").build());
```

The folder is now stored in the database.

2. Define folder's identity

```
ItemIdentity itemId = CoreIdentities.folder(folderId);
```

3. Add folder to structure

```
forestSource.apply(new ForestAction.Add(itemId, 0, 0, 0));
```
