

How to Backup Your Workspace

This article is written about Deskzilla, but it applies to JIRA Client as well.

Purpose

Deskzilla stores all local information in a [workspace](#), so by backing up workspace, you save the current state of work in Deskzilla. In the future, you will be able to restore the workspace (or start Deskzilla with the saved workspace in a different location - see [How to Move Deskzilla to Another Computer](#)) and have access to the currently available issues and local changes, even if they are lost in the main workspace location.

Procedure

To backup a workspace:

1. Locate [workspace directory](#).
2. Stop Deskzilla if it is running.
3. Use any backup tool or operating system's copy command to make a full copy of the workspace directory with all contents, including sub-directories.
