

JavaScript API Classes

Structure Javascript API provides a number of classes to be used as base for your own column type implementations. This should be done using [subClass\(\)](#) method.

- [Column Class](#) — A subclass of Column class represents column objects of a specific type.
- [ColumnConfigurator Class](#) — ColumnConfigurator class encapsulates everything related to column type configuration.
- [ColumnOption Class](#) — ColumnOption class represents a single column configuration parameter.
- [ColumnType Class](#) — ColumnType class represents column type.
- [ItemDetailsProvider Class](#) — ItemDetailsProvider class is the extension point for item details.
