Quick Start Guide

1. Notable fixes and improvements

Structure.Pages 1.4 provides following changes:

- Requires Structure 5.2+. If you are using a previous version of Structure, you should upgrade it to the 5.2 or later prior to installing Pages 1.4.
- Fixed: Page details may not render when running Jira over http and Confluence over https.
- Fixed: When using Child Page Extender, pages may not return to original location after a move is undone.

2. Installation and Configuration

A system with Structure and Structure.Pages contains a number of moving parts, some of them from ALM Works, some of them from Atlassian. Therefore, it is very important to correctly install and configure all these parts before trying to build structures with pages.

In brief, the procedure is:

1. Make sure you have compatible versions of Jira and Confluence.
2. Install Structure and Structure.Pages on Jira.
3. Install Structure.Pages Helper on Confluence.
4. Configure Confluence to accept Remote API calls.
5. Configure Application Link between Jira and Confluence, or make sure it is configured correctly.
6. Enable Confluence integration in Structure system settings.
7. Monitor Jira and Confluence logs for messages from Structure.

For a detailed description of the procedure, please see the User's Guide.

2.1. Upgrade

⚠ For Structure.Pages 1.4 to work properly, Structure.Pages.Helper in Confluence should also be upgraded to the 1.4 version.

If you have Structure.Pages installed and working, then you have already figured out the correct configuration. The upgrade should be straightforward:

1. Upgrade Structure add-on to at least version 5.2.0.
2. Install Structure.Pages 1.4, either from the Marketplace or from the Download page.
3. On the Confluence side, install Structure.Pages Helper 1.4.
4. Verify that all plugins are enabled and that on **Administration | Structure | Confluence Integration** you have the link to your Confluence enabled.
5. Monitor Jira and Confluence logs for messages from Structure.
